Theorem (Max-Flow Min-Cut Theorem)

The following statements are equivalent:

- f is a maximum flow on a flow network G;
- 2 There is an s-t cut (A, B) with c(A, B) = |f|;
- There exists no augmenting path in the residual graph G_f .

Proof.

- $2 \Rightarrow 1$: cut capacities are upper bounds for flow values.
- $1 \Rightarrow 3$: Augmenting along a path increases a flow's value.
- $3 \Rightarrow 2$: The set of nodes reachable from the source in G_f gives the cut.

Definition

Given an undirected graph G = (V, E), a set of edges $M \subseteq E$ is a *matching* if each node in V is incident to at most one edge in M.

イロト 不得下 イヨト イヨト 二日

Maximum Bipartite Matching Problem

Problem (The unweighted maximum bipartite matching problem)

- Input: a bipartite graph G = (U, V, E). (Recall: this means all edges have one endpoint in U and the other in V.)
- Output: a matching M with the maximum cardinality.

Maximum Bipartite Matching Problem

- Output: a matching M with the maximum cardinality.

Reducing Bipartite Matching to Max Flow

- Input: G = (U, V, E).
- Construct a directed graph G' with node set $\{s\} \cup U \cup V \cup \{t\}$.

イロト イポト イヨト イヨト 二日

Reducing Bipartite Matching to Max Flow

- Input: G = (U, V, E).
- Construct a directed graph G' with node set $\{s\} \cup U \cup V \cup \{t\}$.
- Add an edge from s to every node in U, and an edge to t from every node in V, each with capacity 1.

Reducing Bipartite Matching to Max Flow

- Input: G = (U, V, E).
- Construct a directed graph G' with node set $\{s\} \cup U \cup V \cup \{t\}$.
- Add an edge from s to every node in U, and an edge to t from every node in V, each with capacity 1.
- For every $(u, v) \in E$, $u \in U$, $v \in V$, add directed edge (u, v) to G', with capacity 1.

How the reduction works

• Ford-Fulkerson finds a max flow f^* in G' in time $O(|E| \cdot (|U| + |V|) + (|U| + |V|)^2) = O(mn + n^2).$

Theorem (Hall's Theorem)

A bipartite graph G = (U, V, E) has a complete matching on U if and only if for any $S \subseteq U$, $|\Gamma(S)| \ge |S|$.

Proof.

Claim: There exists a min cut (A, B) such that $\Gamma(A \cap U) \subseteq A \cap V$.

Theorem (Hall's Theorem)

A bipartite graph G = (U, V, E) has a complete matching on U if and only if for any $S \subseteq U$, $|\Gamma(S)| \ge |S|$.

Proof.

Claim: There exists a min cut (A, B) such that $\Gamma(A \cap U) \subseteq A \cap V$. Reason: If $(u, v) \in E$, $u \in A \cap U$, $v \in B \cap V$, then edges into v contribute ≥ 1 to c(A, B), and edges leaving v contribute 0. Moving v to A, then edges into v contribute 0, and edges leaving v contribute 1.

Theorem (Hall's Theorem)

A bipartite graph G = (U, V, E) has a complete matching on U if and only if for any $S \subseteq U$, $|\Gamma(S)| \ge |S|$.

Proof.

Claim: There exists a min cut (A, B) such that $\Gamma(A \cap U) \subseteq A \cap V$. Reason: If $(u, v) \in E$, $u \in A \cap U$, $v \in B \cap V$, then edges into v contribute ≥ 1 to c(A, B), and edges leaving v contribute 0. Moving v to A, then edges into v contribute 0, and edges leaving v contribute 1. So for any s-t cut (A, B), we can move all $v \in \Gamma(U \cap A)$ to A without increasing the cut's capacity.

Theorem (Hall's Theorem)

A bipartite graph G = (U, V, E) has a complete matching on U if and only if for any $S \subseteq U$, $|\Gamma(S)| \ge |S|$.

Proof.

Claim: There exists a min cut (A, B) such that $\Gamma(A \cap U) \subseteq A \cap V$. Reason: If $(u, v) \in E$, $u \in A \cap U$, $v \in B \cap V$, then edges into v contribute ≥ 1 to c(A, B), and edges leaving v contribute 0. Moving v to A, then edges into v contribute 0, and edges leaving v contribute 1. So for any s-t cut (A, B), we can move all $v \in \Gamma(U \cap A)$ to A without increasing the cut's capacity. So there is an s-t cut (A, B) with c(A, B) < |U| and $\Gamma(A \cap U) \subseteq A$.

Theorem (Hall's Theorem)

A bipartite graph G = (U, V, E) has a complete matching on U if and only if for any $S \subseteq U$, $|\Gamma(S)| \ge |S|$.

Proof.

Claim: There exists a min cut (A, B) such that $\Gamma(A \cap U) \subseteq A \cap V$. Reason: If $(u, v) \in E$, $u \in A \cap U$, $v \in B \cap V$, then edges into v contribute ≥ 1 to c(A, B), and edges leaving v contribute 0. Moving v to A, then edges into v contribute 0, and edges leaving v contribute 1. So for any s-t cut (A, B), we can move all $v \in \Gamma(U \cap A)$ to A without increasing the cut's capacity.

So there is an s-t cut (A, B) with c(A, B) < |U| and $\Gamma(A \cap U) \subseteq A$.

$$\begin{aligned} |U| > c(A,B) = &|U \setminus A| + |A \cap V| \ge |U \setminus A| + |\Gamma(A \cap U)|. \\ \Rightarrow &|U| - |U \setminus A| = |A \cap U| > |\Gamma(A \cap U)|. \end{aligned}$$

• Reducing to network flows and solving by Ford-Fulkerson is not the fastest algorithm to find maximum bipartite matchings.

イロト 不得下 イヨト イヨト

- Reducing to network flows and solving by Ford-Fulkerson is not the fastest algorithm to find maximum bipartite matchings.
- Fastest algorithm known: Hopcroft-Karp algorithm, which runs in time $O(m\sqrt{n})$.

- Reducing to network flows and solving by Ford-Fulkerson is not the fastest algorithm to find maximum bipartite matchings.
- Fastest algorithm known: Hopcroft-Karp algorithm, which runs in time $O(m\sqrt{n})$.
- Basic idea: In each iteration, instead of augmenting along a path, look for a *maximal* set of vertex-disjoint *shortest* augmenting paths, and augment along all of them.
